Efficacy of ELOISIN collyrium

DESCRIPTION:

Clinical research on therapeutic effect of ELOISIN collyrium.

ABSTRACT:

The active principle of ELOISIN collyrium is the aliphatic tachykinin ELEDIOISIN studied in Roma's La Sapienza University by Italian Pharmacologist V. Erspamer proposed four times for Nobel prize. It STIMULATES, not SUBSTITUTES, lacrimal, salivary and other exocrine secretions acting on cholinergic muscarinic receptors M3 present in respective glands. It is useful for contact lens wearers, videoterminal users, aged people, diabetic people and people suffering of rare diseases like lupus erythematosus, sclerodermia, Gougerot-Sjogren syndrome and others. Market is important.
